HUMAN-LED DECISION SUPPORT — NO AUTOMATED SALE

Executive decision

Launch the governed conversation queue and KYC remediation as one programme.

661
Prioritised conversations
Every item passed permission, product, risk, profitability and capacity gates

42.2%
Mean activation probability
Transparent logistic-regression champion

38.1%
KYC overdue rate
Above the 30% internal management ceiling

DECISION REQUIRED

Approve a controlled RM launch; clear overdue KYC by risk, service urgency and customer permission before affected needs become proposals.

MANAGEMENT INTERPRETATION

- Commercial value is material: TRY 16.7m expected incremental first-year profit across the selected queue.
- The transparent model clears discrimination, calibration and lift floors; the challenger remains available for monitoring.
- RM capacity is not binding: average utilisation is 24.3%, maximum utilisation is 60.7%, and the waitlist is zero.
- The sole breach is KYC freshness. It changes execution and requires an accountable remediation path.

Governed operating model

Six lenses converge on one accountable human conversation.

01
Customer 360
Relationship depth, holdings, interactions and observable flows

02
Need
Product-specific behavioural evidence

03
Propensity
Probability of activation

04
Uplift
Incremental response to RM contact

05
Economics
FTP, expected loss, capital and servicing

06
Policy
Permission, KYC, AML, credit and capacity

TECHNICAL DECISION FLOW

Source layer › **Customer 360** › **Models + economics** › **Policy + capacity** › **API / SQL / BI**

Cross-cutting controls: lineage | temporal validation | conduct monitoring | human ownership | reproducible result digest

Portfolio and opportunity snapshot

Aurelia Bank SME Relationship & Sales Intelligence

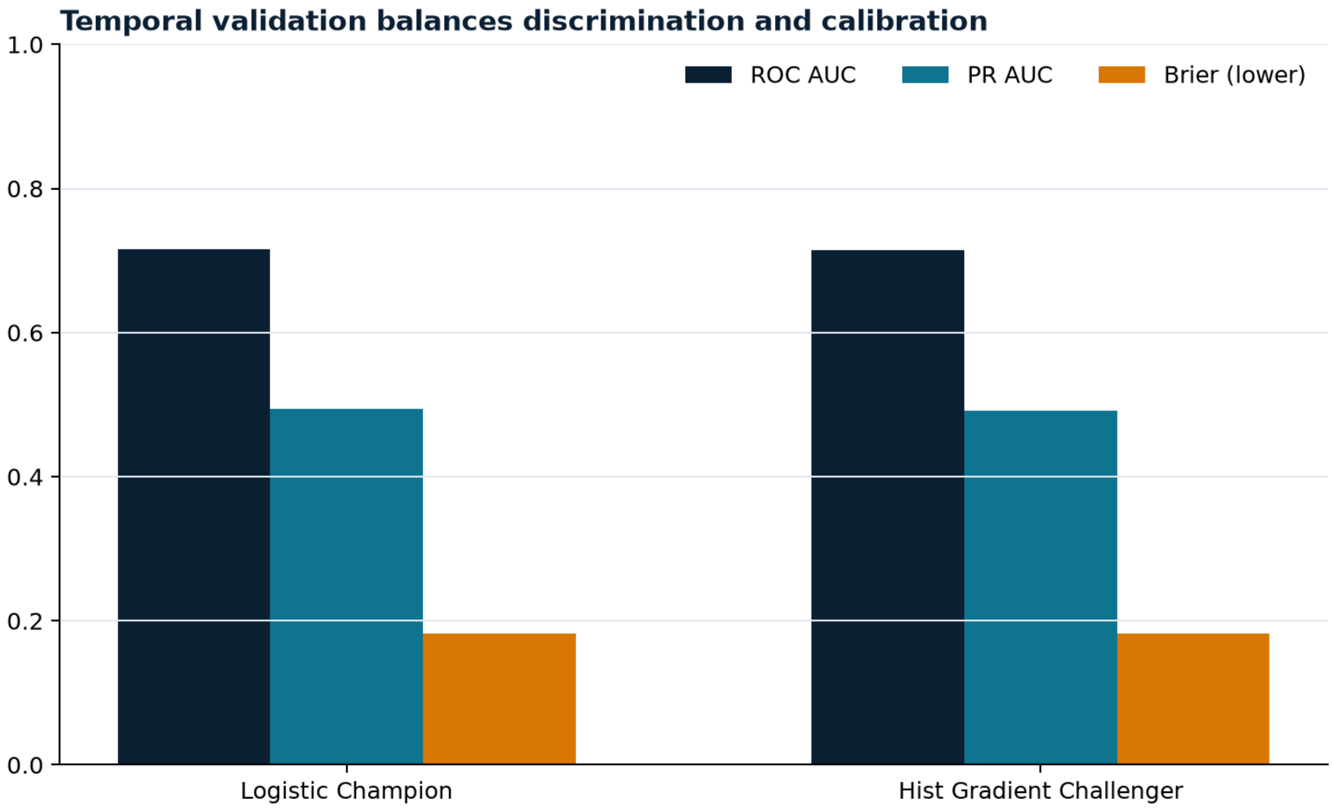
3,200 SME customers	**661** Prioritised conversations
TRY 16.7m Expected incremental profit	**1** Management breaches

PORTFOLIO STRUCTURE

- 3,200 synthetic SMEs are distributed across Micro, Small and Medium size bands and six operational regions.
- The book contains 7,044 product holdings—2.20 products per customer on average—plus 18 months of flows and interactions.
- Customer 360 retains KYC, AML, credit, permission and freshness indicators alongside behavioural features.
- The platform evaluates 18,556 product gaps, qualifies 1,254 through policy thresholds and allocates 661 conversations.

Evidence boundary | Relationship depth and wallet share are transparent proxies. They support inquiry and do not establish customer need or suitability.

Model validation and explainability

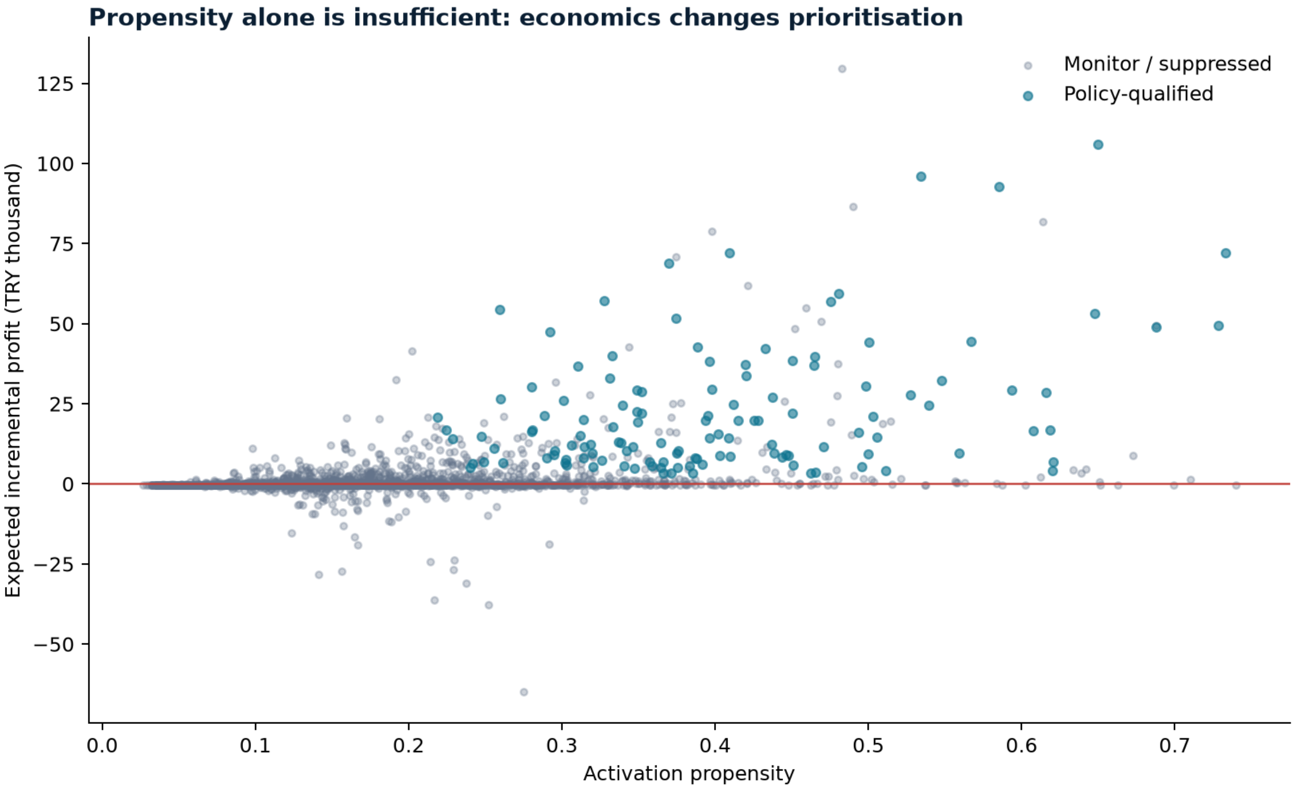


CHAMPION / CHALLENGER EVIDENCE

Model	ROC AUC	PR AUC	Brier	Top-decile lift
Logistic champion	0.715	0.495	0.182	2.07x
Histogram GB challenger	0.715	0.492	0.182	2.04x

- The transparent champion narrowly wins on discrimination, precision-recall and calibration.
- Thirty-seven encoded coefficients and three customer-level reason codes remain available for challenge.
- Synthetic labels validate implementation and ranking logic—not production effectiveness, suitability or fairness.

Incrementality and risk-adjusted economics

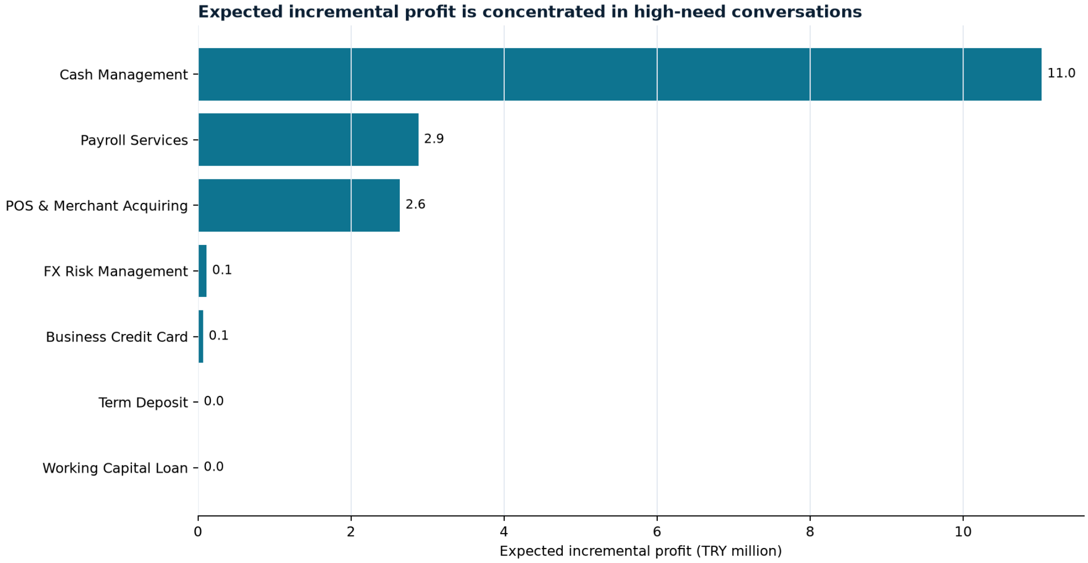


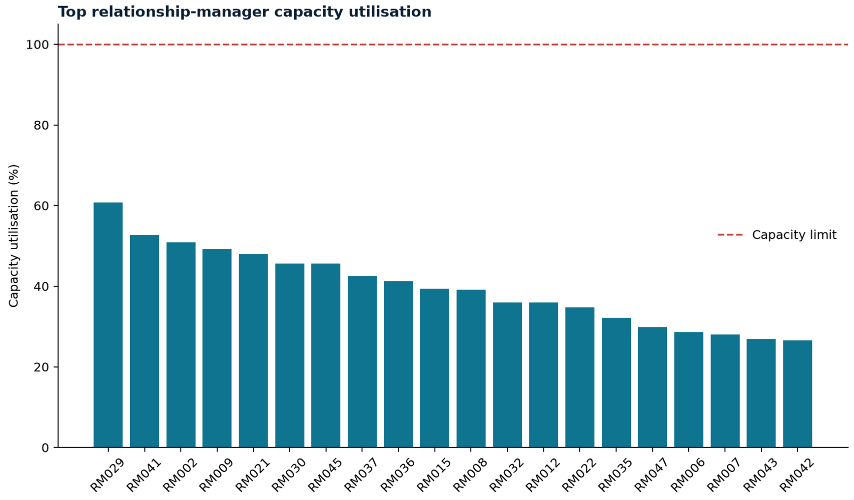
WHY PROPENSITY ALONE IS INSUFFICIENT

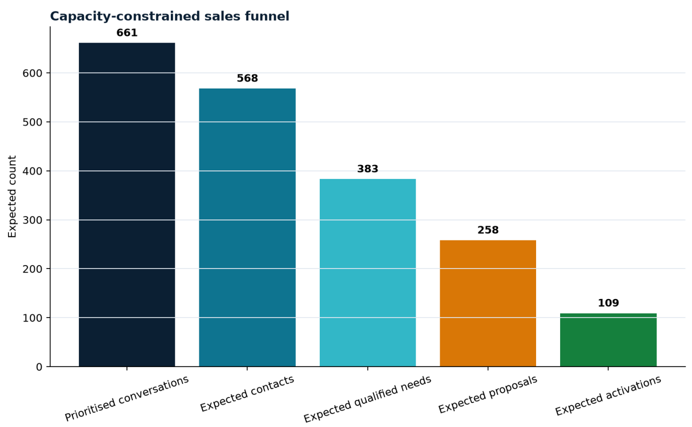
- Mean selected activation probability is 42.2%; mean estimated contact uplift is 9.2%.
- Top-decile predicted uplift is 14.3%; lower-ranked deciles create an explicit holdout challenge.
- Each activated product bridge deducts FTP-style funding, PD×LGD×EAD expected loss, capital charge and servicing cost.
- The selected queue retains TRY 228.1m if activated and TRY 16.7m after probability and incrementality weighting.

Finance boundary | Expected incremental profit is a prioritisation metric—not booked P&L. Realised contribution must be reconciled against governed assumptions.

Product mix, RM capacity and expected funnel







EXECUTION INTERPRETATION

- Cash Management produces 65.9% of expected profit and 343 conversations.
- Average RM capacity utilisation is 24.3%; maximum is 60.7%.
- The expected funnel moves from 661 conversations to 109 activations.
- Capacity is a hard control—not a pressure target.

Controls, conduct and human oversight

CONTROL CONCLUSIONS

Control	Actual	Threshold	Status	Owner
Champion ROC AUC	71.5%	70.0%	PASS	Model Risk
Champion top-decile lift	2.07x	1.35x	PASS	Model Risk
Maximum operational-segment selection gap	5.9%	12.0%	PASS	Conduct Risk
KYC overdue customer rate	38.1%	30.0%	BREACH	KYC Operations
Automated sale decisions	0	0	PASS	Product Governance
Selected conversations without contact permission	0	0	PASS	Privacy Office

Required action | KYC Operations owns the 38.1% overdue-rate breach. Sales cannot treat this dashboard as authority to bypass KYC, AML, privacy, credit or suitability controls.

Ninety-day controlled pilot

Prove incremental customer value before scaling.

0–30 DAYS

Prepare and remediate

- Risk-rank KYC backlog
- Brief authorised RMs
- Freeze assumptions and queue
- Confirm owners and evidence

31–60 DAYS

Run holdout pilot

- Launch the 661-conversation queue
- Preserve treatment/control logic
- Capture need, non-sale and outcome
- Monitor SLA and conduct gaps

61–90 DAYS

Validate and scale

- Reconcile realised economics
- Challenge uplift and drift
- Approve model or policy changes
- Decide controlled next wave

Decision | Approve the pilot, name Sales–KYC–Risk–Finance owners, and review uplift, conduct, KYC freshness and realised profit monthly.

Scale condition | No unresolved KYC/control breach attributable to the pilot; holdout and Finance evidence remains decision-useful.
